

# Chapter 1

Module 1 – “Understanding the Internet and the Web” has shown me new tags that are used in HTML (hypertext markup language). `<b>`, `<i>`, and `<a href=’ ’>` are mentioned in that section and that helps visual how and where to include specific tags without needing CSS. Also knowing that the URL is a visual of where the file is located which allows easier troubleshooting when working on personal websites.

Understanding how cookies work has allowed me to be extra careful when accepting/declining. I did not know the cookies are stored on your hard drive and are accessed when reaching a specific site. They contain data such as what ads have appeared and what will appear next, on top of what else is going on behind the scenes.
